

### **Characteristics of the Ceramic® coating:**

The main advantage of this coating is that it **reduces the braking distance**, even in wet conditions, and it **increases the durability of the rim**. Initially, the wear of the brake pads will be greater with this type of coating than with a conventional treatment. Consequently, use brake pads specifically manufactured for rims with Ceramic coating.

Since this coating is very hard, it is also sensitive to impacts. Chipping may therefore occur following a major shock in which the rim has been deformed. **A limited amount of chipping does not mean the rim must be replaced and does not affect braking performance.**
